Engineering and Informatics, Information System, Universitas Multimedia Nusantara[12345]
Tangerang Regency, Banten, Indonesia

Abstract

This study aims to analyze the effect of cinema ticket prices on the frequency of cinema attendance among Information System students class of 2024 at Multimedia Nusantara University. The research isolates pricing-related variables such as ticket price, ticket type, personal budget, location, and day of visit without being tied to specific platforms such as M-TIX or TIX.ID. A total of 121 responses were collected through an online questionnaire and analyzed using statistical tools including Chi-Square, Cronbach's Alpha, and correlation tests. The findings show that ticket price, ticket type, location, and viewing day significantly affect cinema-going frequency, while entertainment budget does not have a statistically significant impact. The results emphasize that strategic pricing and consumer-centric service enhancements are critical to increasing cinema attendance in the face of growing competition from digital streaming alternatives.

Index Terms: audience behavior; cinema attendance; chi-square test; cinema pricing; consumer preference; dynamic pricing; entertainment spending; ticket type

I. Introduction

One of the most famous entertainment businesses today is film, an activity that allows viewers to feel direct and deep sensations through various mediums, including films [4]. Along with the increasing public interest in entertainment, especially experience based entertainment, the cinema industry in Indonesia continues to show significant development. This is indicated by various developments, such as the increasing number of cinema networks, expansion to various regions, and the increasing number of films, both local and international, being shown. However, in the midst of this growth, industry players still face challenges in maintaining the level of audience visits.

There are several factors that influence consumer decision-making to visit the cinema. Based on previous research, price has a significant influence on the decision to purchase cinema tickets [1]. Cinema ticket prices and film screening days, between weekdays or weekends, viewers tend to choose days with more affordable ticket prices and more flexible times [2]. The location of the cinema has a significant influence on the decision to purchase cinema tickets, consumers tend to choose cinemas that are easy to reach and in strategic locations [3]. Not only that, various types of tickets, such as regular, premium, or IMAX tickets, where these types of tickets also reflect the audience's choice of the quality of the viewing experience related to the amount of budget allocated by individuals for entertainment, especially watching movies because lifestyle has a significant influence on the decision to purchase cinema tickets [4].

Therefore, to understand how consumers behave when they want to watch movies in a comprehensive manner, this study examines various factors against the frequency of watching movies in the cinema. This approach is expected to provide a more complete picture of audience preferences and considerations in the context of the Indonesian cinema market, as well as provide valuable input for cinema managers in designing more effective and targeted marketing strategies.

II. Literature Review

A. Overview

2.1 Cinema

Cinema is one of the popular entertainment facilities that continues to grow along with technological advances and changes in people's lifestyles. In Indonesia, cinemas such as Cinepolis, CGV, and Cinema XXI offer a comfortable viewing experience with modern facilities, such as a large screen, quality sound system, and an attractive place concept [1]. However, competition between cinemas is getting tighter, especially with the emergence of streaming platforms that offer the convenience of watching at home. To retain customers, cinemas need to pay attention to factors such as service quality, price, location, promotion, and consumer satisfaction [2][3].

2.2 Hypothesis Test

Hypothesis testing is a branch of Inferential Statistics that is used to test the truth of a statement statistically and draw conclusions about whether the statement will be accepted or rejected [13].

2.3 Chi-Square Test

Chi Square is one of the statistical uses to decide whether a hypothesis is rejected or not. The strength of the correlation relationship is measured between the range of 0 to 1. If t count is greater than t table then H0 is rejected, conversely if t count is smaller than t table then H0 is accepted. This technique is carried out if the population is more than 30 so that the results obtained are not in doubt [15].

2.4 Cronbach's Alpha Test

Cronbach's Alpha is a method for measuring the reliability of a questionnaire concerning the internal consistency of the instrument, specifically how well the items in the questionnaire correlate with each other and consistently measure the same construct. However, prior to this, it must be ensured that reliability testing has been conducted to calculate the correlation between the scores of each item and the total score of the questionnaire. If the correlation value is greater than the critical value, then it can be stated that the item is valid. After that, reliability is tested with Cronbach's Alpha, and the results are compared with the critical value to determine whether the instrument is reliable [14].

Interpretation of Cronbach's Alpha:

- 0.90 and above: Excellent reliability.
- 0.80 - 0.90: Good reliability.
- 0.70 - 0.80: Acceptable reliability.
- 0.60 - 0.70: Questionable or possibly acceptable reliability.
- Below 0.60: Poor reliability.
- Below 0.50: Unacceptable reliability.

2.5 Correlation Test

Correlation testing is a statistical analysis technique that is included in one of the techniques for measuring associations. Correlation is useful for measuring the strength of the relationship between two or more variables on certain scales. Correlation has the possibility of testing a two-tailed hypothesis. The closer the range value is to 1, the more the variables are said to be correlated. Correlation is unidirectional if the correlation coefficient value is found to be positive, conversely if the correlation coefficient value is negative, the correlation is said to be non-unidirectional [16].

2.6 Price Perception Theory and Entertainment Products

Ticket price is the price that must be paid by consumers to get services or products. In the context of movie tickets, tickets are objects purchased by consumers in order to watch a movie show in the cinema. Price is one of the main factors in making cinema ticket purchase decisions. Price perception is defined as a consumer's assessment of the financial sacrifice to obtain a product/service [1]. In the context of movie theaters, ticket prices are influenced by facilities (big screen, sound, cleanliness), showtime (weekday vs weekend), and additional benefits (student discounts, promo packages) [5].The right pricing strategy is directly correlated with the level of customer satisfaction [1]. In general, consumers place price as the main consideration before purchasing cinema ticket services [7].

B. Previous Works

Various previous studies have found a significant influence between cinema ticket prices and audience behavior. This study has the same theme as previous research, namely ticket prices as a factor influencing consumer decisions to watch at the cinema. According to Oktaviani et al, Dirnaeni et al, and Ar-Rayhan & Sulistiani found that the price variable has a significant influence on consumer viewing interest in theaters, ticket purchase decisions, and customer satisfaction ($t = 30.207$; $p < 0.05$) [6][2][1]. These findings are also reinforced by silitonga et al who stated that price has a strong influence on the decision to purchase cinema tickets among students. another similarity is that the research subject also focuses on students [8].

However, there are differences in focus with some previous studies, such as Putra el at and Fauzan et al, which emphasize the role of cinema ticket purchasing applications such as M-TIX and TIX.ID and features such as discounts that make up the e-ticketing ecosystem. our research does not examine specific applications, but focuses on price perceptions in general [10][5]. research by utomo et al produces different research results that price does not have a significant effect, indicating that the effect of price can be contextual depending on the location and purchasing power of the audience [9]. methodologically, most of the previous studies used a survey-based quantitative approach and correlation analysis which means the same as this study. Some studies such as Dirnaeni et al and Rajabiyanor et al even provide strong statistical data such as t-values and p-values, which strengthen the reliability of their findings [2][7].

The direction of our research differs from most of the previous studies in that it does not focus on a specific application or movie theater but focuses on a specific context, namely the students of Multimedia Nusantara University majoring in information systems class of 2024 and how they respond to movie ticket prices in general. This research also does not mix variables such as service quality and promotion but prefers to isolate the price variable in order to measure its impact specifically. Thus our research tries to fill a gap that has not been widely discussed, namely the direct relationship between price perceptions and visit frequency without relying on specific locations or digital service elements.

III. Methodology

A. Data Collection

To strengthen the basis of our research, several previous works are reviewed to identify the key findings, methodologies, and gaps between the studies. Here we include a list of previous work tables.

Table 1: List of Previous Works

Research	Main Variables	Key Findings
Oktaviani et al. (2023)	Price, Location, Service	Significant price (Adj. R^2=0.587)
Dirnaeni et al. (2024)	Price	t=5.007; p<0.05
Ar-Rayhan & Sulistiani (2024)	Price, Service	Price: t=30.207; p<0.05
Putra & Patmarina (2023)	Price, Promotion	Simultaneously significant (F>F_table)
Fauzan & Sujana (2022)	Features, Convenience, Discount	Price discount has a significant positive influence (45%)
Utomo (2023)	Price, Location, Service	Price not significant, location & service significant
Rajabiyanor et al. (2022)	Reasonable Price (Feasibility)	t=3.456; p<0.05
Fitriana et al. (2023)	Price, Promotion, Service	Price significant, promotion dominant (35.5%)
Silitonga et al. (2023)	Lifestyle, Price	Price significant
Nurlela (2023)	Price, Promotion	Partial price has a significant influence

The data collecting process was conducted via an online questionnaire to targeted respondents, which are Information System students class 2024 at Multimedia Nusantara University. 102 responses were collected. The population of Informations System students class of 2024 are 219 students, with that being said the acceptable margin of error is 0.05, and the sample size is 141.519 round up to 142 students according to Slovin's Formula $n = \frac{N}{(1+Ne^2)}$. With the current respondent, we have collected 121 responses or 85.2% of the targeted 142 respondents. The questionnaire consisted of 12 numeric statements that have to be answered using the likert scale from 1 (strongly disagree) to 5 (strongly agree), and 3 categorical statements. Every statement is an observed variable for the latent variables represented by factors.

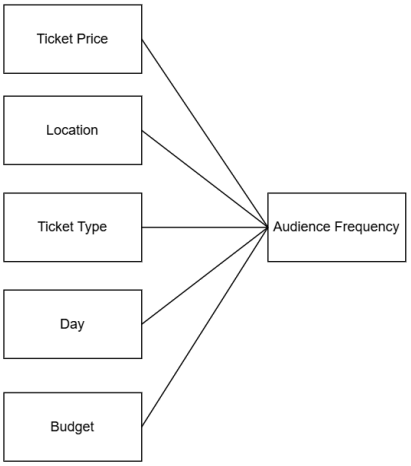

Figure 1: Independent variable relation to Dependent Variable

With the 12 statement being form, we classify each statement accordingly to their own variable as listed below:

- Ticket Price = I1TP
- Ticket Type = I2TT
- Audience Frequency = D1AF
- Budget = I3B
- Location = I4L
- Day = I5D

Given the many references used for this study, we formalize an adapted form to be used for this study, for each variable.

Table 3: List of Adaptation

Construct	Original Definition	Adapted Form	Source
I1TP	The monetary value set for a cinema ticket that customers must pay to access cinema screenings. It reflects the economic trade-off for entertainmen	The degree to which a person perceives the cinema ticket price to be reasonable or expensive compared to alternative entertainme	From Movie to Event Theatre (Welter, 2022)

	t.	nt (e.g., streaming).	
I2TT	The type of ticket purchased (standard, premium, IMAX) affects customer experiences and perceived value (e.g., luxury seating, added services)	The degree which enhances ticket type (e.g., premium seating, special events) increases a visitor's perceived value and willingness to attend.	From Movie to Event Theatre (Welter, 2022)
D1AF	The number of times a consumer attends cinema screenings within a given time frame.	The extent to which a consumer intends to visit the cinema based on price and experience perception	From Movie to Event Theatre (Welter, 2022)
I3B	Disposable income or financial ability to afford leisure activities including movie tickets. Urban-rural and regional gaps influence this affordability.	The degree to which personal financial resources (e.g., allowance or income level) affect the decision to attend the cinema.	Study on Chinese Film Ticket Price Strategy (Xia, 2024)
I4L	Geographic region (first-tier, second-tier cities, etc) impacts pricing and attendance behavior.	The extent to which location and city classification influence access to cinemas and ticket affordability.	Study on Chinese Film Ticket Price Strategy (Xia, 2024)
I5D	Pricing strategies vary based on showtime (weekend vs weekday),	The extent to which screening day or time affects pricing and	Study on Chinese Film Ticket Price Strategy (Xia, 2024)
	affecting demand elasticity.	a person's likelihood to attend.	

Given the definition for each variable above, each constructs/variables are then given an operational definition as constructed below.

Table 4: List of Constructs

Construct	Conceptual Definition	Operational Definition
I1TP	The monetary cost a consumer pays to attend a cinema screening, which influences their perceived value, willingness to pay (WTP), and attendance frequency.	Consumers' perception of cinema ticket pricing compared to other entertainment options.
D1AF	The frequencies at which consumers visit cinemas, influenced by ticket price, customer experience, and perceived value.	The number of times consumers attend cinema screening within three months.
I2TT	The classification of cinema tickets based on additional services offered (e.g., premium seating, special events), affecting perceived value and willingness to attend.	Preference for or perception of different types of cinema ticket offerings

I5D	The specific day within a week that may influence consumers' decision to watch movies, based on lifestyle or schedule.	The day of the week on which the respondent usually prefers to attend cinema screenings.
I4L	The geographical place (city) where consumers attend cinema screenings, impacting access and moviegoing behavior.	The city where the respondent typically watches movies.
I3B	The monthly budget set aside by consumers specifically for entertainment, which can impact their willingness to watch movies.	The amount of money respondents allocate monthly for entertainment activities, including cinema

For each variable, there needs to be a method to measure each statement answer on the questionnaire. Hence, we form the indicators to measure each answer on the questionnaire.

Table 5: List of Indicators

Construct	Indicators
I1TP	● Satisfaction with ticket price ● Reasonableness of ticket price ● Willingness to accept dynamic pricing
D1AF	● Number of visits per quarter ● Intention to increase visits if prices are lower ● Frequency of weekend vs weekday visits
I2TT	● Preference for premium tickets ● Influence of luxury features on attendance ● Willingness to pay more for enhanced experiences
I5D	● Preferred day for cinema visit ● Frequency of weekday vs weekend visits
I4L	● Type of area (urban vs rural) ● Economic development level of the area
I3B	● Monthly entertainment budget amount ● Willingness to spend on cinema

B. Data Analysis

Following the completion of definition adapted form, operational definition, and indicators, we then form the statement that'll be used for the questionnaire alongside its response options.

Table 6: List of Questions

Construct	Questions	Response Options
I1TP	I am satisfied with the current cinema ticket price	Strongly Disagree 1 2 3 4 5 Strongly Agree
I1TP	I believe the current pricing for a cinema ticket is reasonable and affordable than other entertainment options (e.g., streaming services, concert, etc.)	Strongly Disagree 1 2 3 4 5 Strongly Agree
I1TP	I am willing to pay for flexible ticket pricing (cheaper prices on weekdays)	Strongly Disagree 1 2 3 4 5 Strongly Agree
D1AF	I have visited the cinema more than once in the past 3 months	Strongly Disagree 1 2 3 4 5 Strongly Agree

I2TT	I will visit the cinema more frequently if the ticket prices are reduced by 20%	Strongly Disagree 1 2 3 4 5 Strongly Agree
I2TT	I prefer regular cinema tickets compared to premium/special event tickets	Strongly Disagree 1 2 3 4 5 Strongly Agree
I2TT	I am willing to pay a higher price for a ticket with premium benefits (e.g., luxury seating, exclusive screening)	Strongly Disagree 1 2 3 4 5 Strongly Agree
I4L	I visit cinemas in urban areas	Strongly Disagree 1 2 3 4 5 Strongly Agree
I3B	I am willing to spend outside of my entertainment budget for a special screening	Strongly Disagree 1 2 3 4 5 Strongly Agree
I3B	I allocate some money for my entertainment activities for each month	Strongly Disagree 1 2 3 4 5 Strongly Agree
I3B	I allocate my budget for entertainment activities	Less than Rp 100,000 Rp 100,000-300,000 Rp 300,000-500,000 More than Rp 500,000
I5D	I prefer going to cinema on the weekdays	Strongly Disagree 1 2 3 4 5 Strongly Agree
I5D	I prefer going to cinema on the weekends	Strongly Disagree 1 2 3 4 5 Strongly Agree
I5D	I frequently watch movies in the cinema on any day of the week	Monday Tuesday Wednesday Thursday Friday Saturday Sunday
I4L	I usually watch movies at cinemas in	North Jakarta East Jakarta South Jakarta West Jakarta Central Jakarta Tangerang City South Tangerang Tangerang Regency

C. Hypothesis

Independent Variable:

H1 Ticket Price: The higher ticket price increase, the number of cinema-goers decreases

H2 Ticket Type: Some ticket attract more attention than others

H3 Budget: Allocating some funds for entertainment increase the influences of cinema attendance

H4 Location: The typical cinema-goers are from urban location

H5 Day: People tend to go to the cinema on weekends compared to weekdays

Dependent Variable

H6 Audience Frequency: Audience frequency is significantly influenced by ticket price, ticket type, budget, location, and day of the week.

IV. Result and Discussion

After gathering data from the questionnaires, we did a correlation test to see whether our questionnaire results are reliable or not by using cronbach alpha as our reliability test. Referring to literature review 2.4 for cronbach alpha, we understand the measurement for a good result Cronbach's alpha is at the minimum .70. Then Chi-squared tests are used to see the correlation between each independent value with dependent values.

Table 7: Correlation Test

Item #	Test	p-value	
I1TP	Cronbach-alpha	0.851	Merged: nI2TT, nD1AF
I1TP	Chi-squared	2.939757e-07	nD1AF
I4L	Chi-squared	0.002656965	nD1AF
I2TT	Chi-squared	1.785383e-06	nD1AF
I5D	Chi-squared	0.01862917	nD1AF
I3B	Chi-squared	0.2933323	nD1AF

With the questionnaire data collected, we concluded the modus answers of each questions as shown in the following results.

Table 8: List of Answer Modus

Construct	Questions	Modus
I1TP	I am satisfied with the current cinema ticket price	3
I1TP	I believe the current pricing for a cinema ticket is reasonable and affordable than other entertainment options (e.g., streaming services, concert, etc.)	4
I1TP	I am willing to pay for flexible ticket pricing (cheaper prices on weekdays)	4
D1AF	I have visited the cinema more than once in the past 3 months	1
I2TT	I will visit the cinema more frequently if the ticket prices are reduced by 20%	4
I2TT	I prefer regular cinema tickets compared to premium/special event tickets	5
I2TT	I am willing to pay a higher price for a ticket with premium benefits (e.g., luxury seating, exclusive screening)	2
I4L	I visit cinemas in urban areas	3
I3B	I am willing to spend outside of my entertainment budget for a special screening	3
I3B	I allocate some money for my entertainment activities for each month	4
I3B	I allocate my budget for entertainment activities	Less than Rp 100,000
I5D	I prefer going to cinema on the weekdays	2
I5D	I prefer going to cinema on the weekends	4
I5D	I frequently watch movies in the cinema on any day of the week	Saturday
I4L	I usually watch movies at cinemas in	South Tangerang

After processing the 121 data from the questionnaire, another independent to dependent test using chi-squared is conducted to test the original hypothesis, with the newest chi-squared independent to dependent variable test as presented below.

Table 9: Chi-Squared Independent to Dependent variable test

No. Test	X	Y	p-value
H1a	I1TP	D1AF	2.939757e-07
H2a	I4L	D1AF	0.002656965
H3a	I2TT	D1AF	1.78583e-06
H4a	I5D	D1AF	0.01862917
H5a	I3B	D1AF	0.2933323

First off, to determine whether the p-value reject the null or fail to do so, we should look whether the result is less or more than 0.05. We reject the null hypothesis when the p-value are less than 0.05, but if its more than 0.05, then we fail to reject the null hypothesis.

Hence, we can conclude that the first test to fourth test succeed in rejecting the null hypothesis, while the fifth test fails to reject the null hypothesis. With the current result, we can now compare each test to the original hypotheses from H1 to H5 to evaluate their support, as listed below.

Table 10: Hypothesis Summary

Hypothesis	Description	Result
H1 ⟶ H1a	Higher ticket price reduces attendances	Significant and supported
H2 ⟶ H2a	Some ticket types attract more attention	Significant and supported
H3 ⟶ H3a	Budget impacts cinema attendance	Not significant and not supported
H4 ⟶ H4a	Location affects attendance	Significant and supported
H5 ⟶ H5a	People prefer going on certain days	Significant and supported
H6 ⟶ H6a	Audience frequency are influenced by each variables above	Supported except by H3

Therefore, the result above supports H1, H2, H4, and H5, except for H3. This result in partial support for H6, since originally it was stated that Audience Frequency is influenced by all the independent variables, although the evidence doesn't support Budget as a contributing factor.

Afterwards, another chi-squared test are conducted for the same variables, independent to dependent, but now using a specified questions to be used for analysis

Table 11: Independent to Dependent variable using Chi-Squared Test for Each Questions Type

No. Test	X	Y	p-value	Questions	
1	I1TP	D1AF	2.939757e-07	1	4
2	I4L	D1AF	0.002656965	15	5
3	I2TT	D1AF	1.78583e-06	7	4
4	I5D	D1AF	0.01862917	14	5
5	I3B	D1AF	0.2933323	11	4

Since the test for each question type has been conducted, now we will proceed to search for the correlation between numeric questions using the spearman correlation test as shown in the following results.

Table 12: Spearman Correlation Test for Numeric Questions

No. Test	X	Y	p-value	Significance
1	satisfaction	Reasonable Pricing	8.655523e-14	Yes
2	Reasonable Pricing	Flexible Pricing	1.049805e-07	Yes
3	Flexible Pricing	Regular Ticket Preferences	1.96855e-13	Yes
4	Cinema Visits 3 Months	Price Reduction Visit	1.650779e-06	Yes
5	Price Reduction Visit	Regular Ticket Preference	2.367343e-16	Yes
6	Regular Ticket Preference	Urban Cinema Visits	3.121582e-13	Yes
7	Premium Ticket Willingness	Special Screening Willingness	8.793889e-11	Yes
8	Urban Cinema Visits	Weekend Preference	5.300638e-05	Yes
9	Special Screening Willingness	Weekday Preference	0.7744549	No
10	Monthly Entertain	Weekend Preference	0.2326529	No

	ment Budget			
11	Weekday Preference	Weekend Preference	0.001105563	Yes

Alongside using spearman correlation to measure the correlation between numeric questions, we also conducted a spearman correlation test to search correlation between categorical question as shown in the following results.

Table 13: Spearman Correlation Test for Categorical Questions

No. Test	X	Y	p-value	Significance
1	Budget Allocation	Weekly Cinema Visits	0.9505133	No
2	Budget Allocation	Cinema Location	0.2019086	No
3	Weekly Cinema Visits	Cinema Location	0.02402943	Yes

V. Conclusion

This study highlights that cinema ticket prices have a significant effect on the frequency of Information Systems students class of 2024, Multimedia Nusantara University visit to the cinema. Key influencing variables include ticket price, ticket type, cinema location, and the preferred day of attendance. The correlation and chi-square analysis support the conclusion that viewers are more likely to attend on weekends and are responsive to variations in ticket prices and perceived value. However, monthly entertainment budgets were found to be statistically insignificant, suggesting that perceived affordability and personal preference outweigh fixed financial planning in influencing cinema attendance. This highlights that pricing strategy and perceived experience quality are more impactful than budgetary limitations among students.

These results offer practical recommendations for cinema operators aiming to increase foot traffic and revenue. Implementing flexible pricing strategies, such as weekday discounts or bundled ticket offers, could attract more visitors. Differentiated ticket types with premium features may also appeal to segments willing to pay for a better experience. Moreover, focusing on urban accessibility and consumer-friendly promotions can enhance cinema competitiveness against digital platforms. Overall, this research contributes to a more nuanced understanding of consumer behavior in Indonesia's entertainment industry, especially among younger demographics.

Cronbach's Alpha: 0.851
```

Figure. A.17. - Cronbach's Alpha Value

```
1. I am satisfied with the current cinema ticket price : 3
2. I believe the current pricing for a cinema ticket is reasonable and affordable than other entertainment options (e.g., streaming
services, concert, etc.) : 4
3. I am willing to pay for flexible ticket pricing (cheaper prices on weekdays) : 4
4. I have visited the cinema more than once in the past 3 months : 1
5. I will visit the cinema more frequently if the ticket prices are reduced by 20% : 4
6. I prefer regular cinema tickets compared to premium/special event tickets : 5
7. I am willing to pay a higher price for a ticket with premium benefits (e.g., luxury seating, exclusive screening) : 2
8. I visit cinemas in urban areas : 3
9. I am willing to spend outside of my entertainment budget for a special screening : 3
10. I allocate some money for my entertainment activities for each month : 4
11. I allocate my budget for entertainment activities : Less than Rp 100.000
12. I prefer going to cinema on the weekdays : 2
13. I prefer going to cinema on the weekends : 4
14. I frequently watch movies in the cinema on any day of the week : Saturday
15. I usually watch movies at cinemas in : South Tangerang

Spearman correlation results for 'satisfaction' based correlations:

Spearman correlation between satisfaction and reasonablePricing :
rho = 0.6121388
p-value = 8.655523e-14
There is significant relationship

Spearman correlation between satisfaction and flexiblePricing :
rho = 0.5811248
p-value = 2.784365e-12
There is significant relationship

Spearman correlation between satisfaction and cinemaVisits3months :
rho = 0.4112316
p-value = 2.791362e-06
There is significant relationship

Spearman correlation between satisfaction and priceReductionVisit :
rho = 0.4508423
p-value = 2.111125e-07
There is significant relationship

Spearman correlation between satisfaction and regularTicketPreference :
rho = 0.5355633
p-value = 2.460308e-10
There is significant relationship

Spearman correlation between satisfaction and premiumTicketWillingness :
rho = 0.4456229
p-value = 3.023556e-07
There is significant relationship

Spearman correlation between satisfaction and urbanCinemaVisits :
rho = 0.4109416
p-value = 2.841255e-06
There is significant relationship

Spearman correlation between satisfaction and specialScreeningWillingness :
rho = 0.2541763
p-value = 0.004903964
There is significant relationship

Spearman correlation between satisfaction and monthlyEntertainmentBudget :
rho = 0.2584325
p-value = 0.004209286
There is significant relationship

Spearman correlation between satisfaction and weekdayPreference :
rho = 0.2976754
p-value = 0.0009133376
There is significant relationship

Spearman correlation between satisfaction and weekendPreference :
rho = 0.2378182
p-value = 0.008623152
There is significant relationship
